

Orion Mobility Systems Ltd.

FY2025 Board Performance Pack

Field	Value
Tenant	Orion Capital
Portfolio company	Orion Mobility Systems Ltd.
Department	Finance
Visibility	Finance only
Reporting period	FY2025 with FY2024 comparison
Currency	INR crore
Document ID	ORION-FIN-PDF-2025-001
Status	Approved synthetic source

Executive conclusion: revenue increased by 25.0%, but EBITDA margin declined from 15.0% to 10.0%. The primary causes were battery input inflation, customer discounting, and expansion of the service network.

This is fictional synthetic data created to test secure ingestion, Finance-only retrieval, citations, and deterministic calculations. It is not investment advice.

1. FY2025 Financial Performance

Selected management reporting figures; structured source is the companion Excel workbook.

Metric	FY2024	FY2025	Change
Revenue	120.00	150.00	+25.0%
Cost of Goods Sold	72.00	96.00	+33.3%
Gross Profit	48.00	54.00	+12.5%
Operating Expenses (excl. D&A;)	30.00	39.00	+30.0%
EBITDA	18.00	15.00	-16.7%
EBITDA Margin	15.0%	10.0%	-5.0 pp
Net Profit	8.25	4.50	-45.5%
Closing Cash	25.00	18.00	-28.0%
Bank Debt	40.00	55.00	+37.5%

Calculation ground truth: FY2024 EBITDA margin = 18 / 120 = 15.0%. FY2025 EBITDA margin = 15 / 150 = 10.0%.

The companion workbook is the authoritative structured source for metric extraction. This page is designed for document retrieval and citation tests.

2. Drivers of Margin Compression

2.1 Battery input inflation

Average battery-cell acquisition cost increased approximately 18% during FY2025. Supplier renegotiations reduced part of the increase, but the residual impact raised Cost of Goods Sold faster than revenue.

2.2 Customer discounting

Management introduced fleet and channel discounts to accelerate unit adoption. The program supported revenue growth but reduced realized gross margin, particularly in the second half of FY2025.

2.3 Service-network expansion

Orion opened 14 service locations and hired 86 service and field-operations employees. These investments added approximately INR 5.5 crore of annualized operating cost before the locations reached target utilization.

2.4 Logistics and warranty

Expedited inbound freight and a higher warranty provision added approximately INR 2.0 crore of combined cost. No single item explains the full margin decline; the change reflects the combined effect of input costs, pricing, and expansion.

Supported answer for retrieval evaluation: margin declined because COGS and operating expenses grew faster than revenue, driven by battery costs, discounting, service expansion, freight, and warranty provisions.

3. Liquidity, Risks, and Management Actions

Liquidity

Closing cash declined from INR 25.0 crore to INR 18.0 crore. Bank debt increased from INR 40.0 crore to INR 55.0 crore. Under the synthetic stress assumption of INR 3.0 crore monthly burn, cash runway is 6.0 months.

Key risks

Risk	Likelihood	Impact	Mitigation
Battery cost remains elevated	Medium	High	Dual sourcing and quarterly price reset
Service locations ramp slowly	Medium	Medium	Utilization thresholds and hiring controls
Debt cost increases	Medium	Medium	Refinancing review and cash controls
Demand slows after discounting	Low-Medium	High	Channel monitoring and product-mix actions

Management actions for FY2026

Management plans to renegotiate battery supply contracts, reduce broad discounting, pause new service-site commitments until utilization improves, and target quarterly cash controls. These are plans, not guaranteed outcomes.

Insufficient-evidence test: this pack contains no audited FY2026 revenue, no share price, and no acquisition recommendation. The assistant should abstain if asked for those values.
